The GMO Potato: from Farm to Plate

GMOs allow farmers to grow more with less resources.3 In a single year, GMOs allowed farmers to use **59.7M fewer** acres of land to grow the same amount of food.4

GMOs go through rigorous review.

On average, GMOs take **13 years and \$130M** of research and development before coming to market.1 In the U.S., this review and approval is conducted by:

GM potatoes reduce pesticides with late blight disease protection that enables farmers to reduce fungicides by 50%.5

Enhanced food safety. GM potatoes have reduced acrylamide, a potential carcinogen formed during frying.⁷

GM potatoes reduce food waste via the non-browning/ non-bruising trait. Potatoes bruised during storage and transport contribute to 400M lbs. of **food waste** each year.⁶

GM potatoes are SAFE to eat and SUSTAINABLE to produce.
